

Electronic musical instruments

COMPUTER
MUSIC
TOOLS

Computer music tools

- Software for creation of computer music (both single sounds and whole musical pieces).
- We have already learned about:
 - **samplers** – musical instruments and software for creating instrument banks,
 - **MIDI sequencers** – software for recording, editing and playback of MIDI codes, controlling other musical instruments (hardware and software).

VST

Virtual Studio Technology (VST) – a standard from Steinberg.

- **VST plugins:**
 - **VST effects:** sound effects; they receive digital sounds and they output processed sounds,
 - **VST instruments (VSTi):** they receive MIDI codes and generate digital sounds (by synthesis, sampling, etc.) and they send them to the output,
 - **VST MIDI effects:** they process MIDI codes (rarely used).
- **VST host:** a software that sends data to plugins and collects the results.

VST instruments

The task of a VSTi programmer is to:

- write an algorithm that generates digital sounds (using any method) according to the received parameters,
- create a user interface,
- define MIDI Control Change parameters and their interpretation (how they affect the generated sound).

A programmer does not need to worry about input and output functions – this is the task of the host program.

VST host - DAW

Modern VST hosts are **digital audio workstations (DAW)**

- **audio** tracks:
 - recorded digital sound (instruments, vocals),
 - use VST effects;
- **MIDI** tracks:
 - only recorded MIDI codes,
 - control VSTi or hardware instruments,
 - allow for sequencer functions (MIDI code editing),
 - a digital sound is created only during the mastering.

Advantages of VSTi

Why should we use VSTi and MIDI tracks instead of simply recording sounds on audio tracks:

- we can easily edit MIDI codes (individual notes),
- we can modify the VSTi sound by changing its parameters,
- we can change the VSTi leaving the same MIDI sequences,
- we can use many instruments at the time, the processing power of a PC is the limit.

Running VSTi

How to run a single VSTi without installing a complex DAW?

- Download free *SAVIHost*
(<http://www.hermannseib.com/english/savihost.htm>)
- Put *savihost.exe* in the same location as the DLL file of the VSTi.
- Rename the file so that EXE and DLL names match, e.g.:
 - the plugin file is *Synth1 VST.dll*
 - rename *SAVIHost.exe* to *Synth1 VST.exe*
- Run the executable file. The plugin is loaded, and we can use it as an instrument.

Computer music programming - CSound

- General purpose programming languages (C++, Java, Python, etc.) do not have easy procedures for computer music creation.
- There are special programming languages developed for creating digital sounds and music.
- **CSound** – one of the most popular music programming languages. A programmer writes procedures for:
 - *orchestra* – code that creates sounds (instruments),
 - *score* – code that creates music from these sounds.
- Many functions, but relatively hard to learn.
- Documentation and many examples are available.

Csound - example

Csound script - simple FM synthesis

[http://booki.flossmanuals.net/
csound/d-frequency-modulation/](http://booki.flossmanuals.net/csound/d-frequency-modulation/)

```
<CsoundSynthesizer>
<CsInstruments>
sr = 48000
ksmps = 32
nchnls = 2
0dbfs = 1
instr 1

kCarFreq = 440      ; carrier frequency
kModFreq = 440     ; modulation frequency
kIndex = 10        ; modulation index

kIndexM = 0
kMaxDev = kIndex*kModFreq
kMinDev = kIndexM*kModFreq
kVarDev = kMaxDev-kMinDev
kModAmp = kMinDev+kVarDev

; oscillators
aModulator poscil kModAmp, kModFreq, 1
aCarrier poscil 0.3, kCarFreq+aModulator, 1

outs aCarrier, aCarrier
endin
</CsInstruments>

<CsScore>
f 1 0 1024 10 1      ; Sine wave for table 1
i 1 0 15
</CsScore>

</CsoundSynthesizer>
; written by Alex Hofmann (Mar. 2011)
```

SuperCollider

- Modern computer music programming language.
- Code written as text (scripts).
- Used for:
 - real time sound synthesis,
 - algorithmic composition.
- Uses a client-server architecture.
- Less examples than Csound.
- Available in many operating systems.
- Ability to create custom instruments.

SuperCollider - example

SuperCollider script to create a simple FM synthesis

http://danielnouri.org/docs/SuperColliderHelp/Tutorials/Mark_Polishook_tutorial/Synthesis/14_Frequency_modulation.html

```
(
SynthDef("fm1", { arg bus = 0, freq = 440, carPartial = 1, modPartial = 1, index = 3, mul = 0.05;
  // carPartial :: modPartial => car/mod ratio

  var mod;
  var car;

  mod = SinOsc.ar(freq * modPartial, 0,
    freq * index * LFNoise1.kr(5.reciprocal).abs);

  car = SinOsc.ar( (freq * carPartial) + mod, 0, mul);

  Out.ar(bus, car)
}).load(s);
)

(
Synth("fm1", [\bus, 0, \freq, 440, \carPartial, 1, \modPartial, 1, \index, 10]);
)

(
s.queryAllNodes;
)
```

Pure Data (pd) / Max/MSP

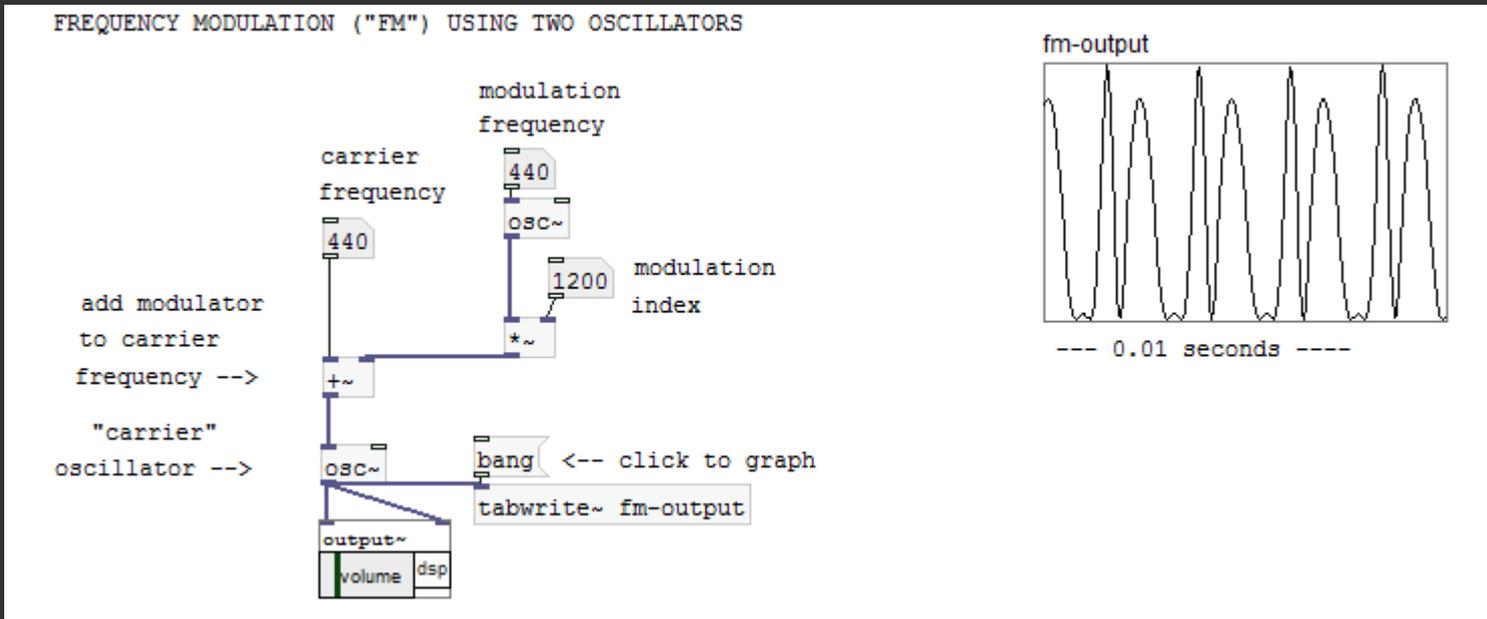

- An alternative approach: visual creation of algorithms in GUI instead of writing a code.
- Implementations:
 - **Max/MSP** – commercial, MacOS,
 - **Pure Data (pd)** – open source (Linux, Windows, Mac).
- Sound processing, synthesis, sampling, MIDI.
- The user interface is rather ascetic.
- More appealing visually, but complex algorithms may look “tangled”.
- Ability to create custom blocks.
- Audio and control signals.

Pure Data - example

A simple FM synthesis in pd

an example included in the installed program (*A09.frequency.mod.pd*)

Trackers

Trackers were popular in 1980s on 16-bit computers (Amiga).

- Combine functions of a sampler and a sequencer.
- **Samples** are very short, they are usually looped.
- **Instruments** – samples with envelope and effects.
- **Patterns** – control sequences that generate music.
- **Order** – defines how the patterns are played.
- **Module** (MOD) – a single file that contains all the data, very small (typically, below 100 KB).

Patterns

Pattern describes how the sounds are generated.

A pattern has a form of a table.

- Columns – **tracks**, voices.
- Rows – **lines**, notes on a timeline.
- Cells – **notes**:
 - pitch,
 - instrument number,
 - loudness,
 - sound effect.

Modular trackers

- Modern trackers use modules (**machines**) instead of recorded samples:
 - **generators** – synthesizers and samplers,
 - **effects** – modify the sound,
 - amplifiers, mixers, etc.
- The machines are controlled with patterns, just like in the original trackers.
- Much more capabilities of music creation.
- Programmers can create custom machines.

Psycle - example of a modular tracker

The screenshot displays the Psycle Modular Music Creation Studio interface. The main window shows a signal flow graph with various modules connected to a central 'MASTER' module. The modules include:

- 00:Keverb Sampler
- 03:Keverb Sampler 2
- 41:CrossDelay
- 01:Delay Sampler
- 40:Reverb
- 42:CrossDelay
- 43:CrossDelay
- 44:CrossDelay
- 05:Dry Sampler
- 02:Pooplog
- 04:Drum2.2

The interface also features a menu bar (File, Edit, View, Configuration, Performance, Help), a toolbar, and a track control section with parameters like Tracks (20), Tempo (125), Lines per beat (4), and Octave (3). A pattern step selector is set to '02: Pooplog'. On the left, there is a vertical timeline with markers from 00:00 to 18:13 and a list of actions (New, Clone, Ins, Del, Cut, Copy, Paste, Clear, Sort). Below the timeline are checkboxes for 'Follow song', 'Record Tweaks', 'Record NoteOffs', 'Multichannel Audition', 'Allow Notes to Effects', and 'Move Cursor When Paste'. The bottom status bar shows 'Pooplog (209,325)' and 'Pos 08 | Pat 08 |'.

Two parameter windows are open:

- 40: Reverb**
 - Pre Delay: 21.1 ms
 - Comb Spread: 512
 - Room size: 32.8 mHz
 - Feedback: 62.0%
 - Absorption: 3295 Hz
 - Dry: 82.0%
 - Wet: 40.6%
 - Filters: 12
- 43: CrossDelay**
 - Delay time: 3.000
 - Feedback: 50.0%
 - Dry: 0.0 dB
 - Wet: -6.0 dB
 - Tick mode: On
 - Ticks: 3

The **02: Pooplog** window shows a grid of parameters for OSC Select, OSC Volume A/B, OSC Wave A/B, OSC PH Env Type, OSC PH Delay, OSC PH Attack, OSC PH Sustain, OSC PH Release, OSC PH LFO Depth, OSC PH LFO Wave, OSC PH LFO Rate, and OSC W Env Mod.

Examples of trackers

Modern trackers:

- *OpenMPT* – a free “traditional” (MOD) tracker, Windows
- *Psycle*, *Buzz* – free modular trackers,
- *Renoise* – a commercial DAW based on the tracker concept.

Some software allow for creation of modular systems that are controlled with MIDI instead of patterns. An example: *NI Reaktor* (commercial).

Algorithmic composition

Algorithmic composition uses software to create musical pieces (“songs”). A computer becomes a composer.

Methods of algorithmic composition (can be used simultaneously):

- grammatic algorithms based on music theory,
- algorithms based on statistic models,
- randomized algorithms,
- fractal algorithms,
- artificial intelligence methods, deep learning.

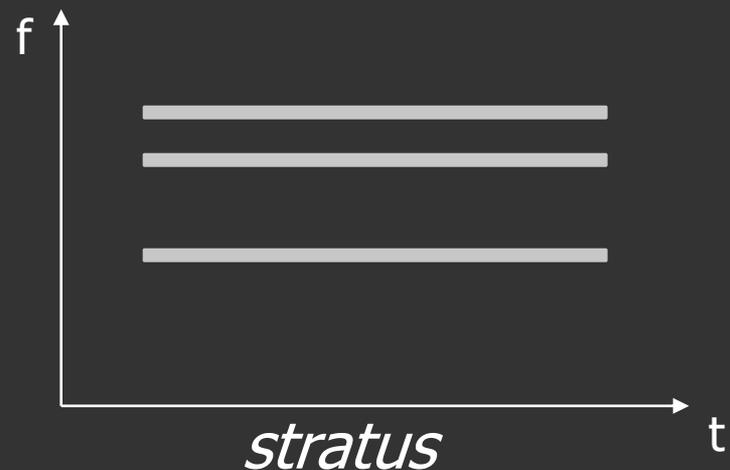

Example software (try it!): *cgMusic*

(<http://codeminion.com/blogs/maciek/2008/05/cgmusic-computers-create-music/>)

Granular synthesis

The granular synthesis method combines sound synthesis with algorithmic composition.

- **Granules** are very short sound fragments (below 50 ms).
- Each granule has pitch and loudness.
- A large set of granules is organized in **clouds** (**soundscapes**) on a time-pitch plot.

Granular synthesis

- We can control pitch, loudness and tempo of the clouds.
- Organized clouds create sounds.
- Clouds can be created by a human or by an algorithm.
- The created sounds are “psychedelic” in nature, not like real sounds. It can be used e.g. to create an original soundtrack.
- Wavelet synthesis is similar to the granular synthesis. It uses wavelet decomposition to create granules with desired parameters.
